Coding of Dermatologic Diagnoses: An Unresolved Issue

La codificación de diagnósticos dermatológicos. Una cuestión aún por resolver

Information is essential in all fields, including medicine. In research, epidemiology, prevention, and health care management, the information we work with must be correctly classified. In particular, information on diagnoses must be recorded and classified uniformly and accurately to ensure common practice among all health professionals over time. Because the number of known diseases is so enormous—and constantly increasing, thanks to medical advances in technology and research—this is not as simple as it may seem at first glance.

The International Classification of Diseases (ICD), in its various versions, is the most widely used system for diagnostic coding. The 10th and current revision of the ICD (ICD-10) has recently been criticized for not including certain diagnoses. In dermatology, an ICD adaptation developed in Spanish years ago attempted to solve this problem. Given this background, it is necessary to analyze the inaccuracies and coding-related difficulties associated with the dermatologic diagnoses included in the ICD-10, with a view to achieving a better classification in the ICD-11.

Local Experience with Vismodegib

Vismodegib, una experiencia local

Vismodegib is the first medication to be approved by the United States Food and Drug Administration and the European Medicines Agency for the treatment of locally advanced basal cell carcinoma in patients who are not candidates for surgery or radiotherapy and for the treatment of metastatic basal cell carcinoma. Therefore, this Hedgehog pathway inhibitor has generated high hopes among oncologists and dermatologists, since no alternative treatment is available for these patients, whose condition is difficult to manage and for whom no standard therapeutic approach has been established.

Initial enthusiasm has been tempered by the emergence of resistance, adverse effects that are sometimes poorly tolerated, possible liver toxicity, and a questionable increased risk of developing squamous cell carcinoma. However, experience with vismodegib as a neoadjuvant approach before surgery is growing. Similarly, we now know more about pulse dosing to diminish adverse effects and combination with other Hedgehog pathway inhibitors to increase effectiveness. Knowledge of the response to this drug in the patients we treat, therefore, is now particularly valuable; hence, the importance of the publication by Bernia et al. 1 in this issue of ACTAS DERMOSIFILIÓGRAFICAS.
